1. Claim 1 is allowed

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Omum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

2. Claims 2 and 3 are rejected under the judicially created doctrine of double patenting over claims 1 and 6 of U. S. Patent No. 6,716,494 since the claims, if allowed, would improperly extend the "right to exclude" already granted in the patent.

The subject matter claimed in the instant application is fully disclosed in the patent and is covered by the patent since the patent and the application are claiming common subject matter, as follows: Claims 2 and 3 represent the obvious method of making the transfer sheet recited in claim 6 of U.S.P. 6,716,494 (i.e. merely apply the transfer material to a support). Interpreting present claims 2 and 3 in light of the specification, it is noted that polyamide particles are preferred. Since the hot-melt polyamide adhesive fine particles of claim 6 in U.S.P 6,716,494 have the same oil absorption as the presently claimed hot-melt polyamide adhesive fine particles, it is inherent that the particles of claim 6 are porous (i.e. oil absorption is a function of porosity). Since claim 6 requires a "separable" transfer layer, use of a conventional

release layer would have been obvious to one of ordinary skill in this art in the absence of unexpected results.

Furthermore, there is no apparent reason why applicant was prevented from presenting claims corresponding to those of the instant application during prosecution of the application, which matured into a patent. See *In re Schneller*, 397 F.2d 350, 158 USPQ 210 (CCPA 1968). See also MPEP§804.

3. In view of the unavailability of the file of parent application 09/890,866, applicants are requested to file copies of the foreign patents cited in S.N. 09/890,866.
